

# DENGUE Y CHIKUNGUNYA ALERT

**From March to May:  
major outbreaks and epidemics**

Although we associate mosquitoes to the warm seasons and summer, the truth is that mosquitoes keep reproducing themselves until the cold comes.

**From March to May there are major outbreaks and epidemics of dengue**

The eggs withstand low temperatures and droughts, and go through winter waiting for the arrival of heat and spring rains to develop.

## HOW TO PROTECT US FROM STINGS?

Wearing light clothing that cover our arms and legs.

Placing mosquito nets on windows and tulle in cribs, beds and strollers to protect babies and young children.

Using DEET-based body repellents or Icaricina, especially in the morning and in the evening, the time when mosquitoes are most active.

Using environmental repellents on anyone of its formats: liquids, tablets or spirals.

**We always recommend reading the repellent labels and following the instructions, since each type is placed and used differently.**
